# LIS3LV02DL

MEMS inertial sensor

3-axis -  $\pm 2g/\pm 6g$  digital output low voltage linear accelerometer

## Features

- 2.16 V to 3.6 V single supply operation
- 1.8 V compatible IOs
- I<sup>2</sup>C/SPI digital output interfaces
- Programmable 12 or 16 bit data representation
- Interrupt activated by motion
- Programmable interrupt threshold
- Embedded self test
- High shock survivability
- ECOPACK® compliant (see [Section 9](#))

## Description

The LIS3LV02DL is a three axes digital output linear accelerometer that includes a sensing element and an IC interface able to take the information from the sensing element and to provide the measured acceleration signals to the external world through an I<sup>2</sup>C/SPI serial interface.

The sensing element, capable of detecting the acceleration, is manufactured using a dedicated process developed by ST to produce inertial sensors and actuators in silicon.

The IC interface instead is manufactured using a CMOS process that allows high level of integration to design a dedicated circuit which is factory trimmed to better match the sensing element characteristics.

The LIS3LV02DL has a user selectable full scale of  $\pm 2g$ ,  $\pm 6g$  and it is capable of measuring acceleration over a bandwidth of 640 Hz for all axes. The device bandwidth may be selected accordingly to the application requirements.

The self-test capability allows the user to check the functioning of the device.

The device may be also configured to generate an inertial wake-up/free-fall interrupt signal when a programmable acceleration threshold is crossed at least in one of the three axes.

The LIS3LV02DL is available in plastic SMD package and it is specified over a temperature range extending from  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

The LIS3LV02DL belongs to a family of products suitable for a variety of applications:

- Free-Fall detection
- Motion activated functions in portable terminals
- Antitheft systems and Inertial navigation
- Gaming and virtual reality input devices
- Vibration monitoring and compensation

**Table 1. Device summary**

| Order code   | Operating temperature range [ $^{\circ}\text{C}$ ] | Package | Packing       |
|--------------|--|---------|---------------|
| LIS3LV02DL   | -40 to +85   | LGA-16  | Tray          |
| LIS3LV02DLTR | -40 to +85   | LGA-16  | Tape and reel |

| 12   | Reserved            | Connect to Vdd   |
| 13   | Vdd                 | Power supply   |
| 14   | GND                 | 0 V supply   |
| 15   | Reserved            | Either leave unconnected or connect to GND   |
| 16   | GND                 | 0 V supply   |

## 2 Mechanical and electrical specifications

### 2.1 Mechanical characteristics

**Table 3. Mechanical characteristics @ Vdd=3.3 V, T=25 °C unless otherwise noted<sup>(1)</sup>**

| Symbol | Parameter   | Test conditions                            | Min. | Typ. <sup>(2)</sup> | Max. | Unit  |
|--------|---|--|------|---------------------|------|-------|
| FS     | Measurement range <sup>(3)</sup>                      | FS bit set to 0                            | ±1.7 | ±2.0                |      | g     |
|        |   | FS bit set to 1                            | ±5.3 | ±6.0                |      |       |
| Dres   | Device resolution                                     | Full-scale = ±2 g<br>ODR1=40 Hz            |      | 1.0                 |      | mg    |
|        |   | Full-scale = ±2 g<br>ODR2=160 Hz           |      | 2.0                 |      |       |
|        |   | Full-scale = ±2 g<br>ODR3=640 Hz           |      | 3.9                 |      |       |
|        |   | Full-scale = ±2 g<br>ODR4=2560 Hz          |      | 15.6                |      |       |
| So     | Sensitivity   | Full-scale = ±2 g<br>12 bit representation | 920  | 1024                | 1126 | LSb/g |
|        |   | Full-scale = ±6 g<br>12 bit representation | 306  | 340                 | 374  |       |
| TCSO   | Sensitivity change vs temperature                     | Full-scale = ±2 g<br>12 bit representation |      | 0.025               |      | %/°C  |
| Off    | Zero-g level offset accuracy <sup>(4),(5)</sup>       | Full-scale = ±2 g<br>X, Y axis             | -70  |                     | 70   | mg    |
|        |   | Full-scale = ±2 g<br>Z axis                | -90  |                     | 90   |       |
|        |   | Full-scale = ±6 g<br>X, Y axis             | -90  |                     | 90   |       |
|        |   | Full-scale = ±6 g<br>Z axis                | -100 |                     | 100  |       |
| LTOff  | Zero-g Level offset long term accuracy <sup>(6)</sup> | Full-scale = ±2 g<br>X, Y axis             | -4.5 |                     | 4.5  | %FS   |
|        |   | Full-scale = ±2 g<br>Z axis                | -6   |                     | 6    |       |
|        |   | Full-scale = ±6 g<br>X, Y axis             | -1.8 |                     | 1.8  |       |
|        |   | Full-scale = ±6 g<br>Z axis                | -2.2 |                     | 2.2  |       |
| TCOff  | Zero-g Level Change Vs Temperature                    | Max Delta from 25°C                        |      | 0.2                 |      | mg/°C |

**Table 3. Mechanical characteristics @ Vdd=3.3 V, T=25 °C unless otherwise noted<sup>(1)</sup>  
(continued)**

| Symbol          | Parameter                                  | Test conditions  | Min. | Typ. <sup>(2)</sup> | Max. | Unit  |
|-----------------|--|--|------|---------------------|------|-------|
| NL              | Non Linearity                              | Best fit straight line<br>X, Y axis<br>Full-scale = $\pm 2$ g<br>ODR=40 Hz |      | $\pm 2$             |      | %FS   |
|                 |  | Best fit straight line<br>Z axis<br>Full-scale = $\pm 2$ g<br>ODR=40 Hz    |      | $\pm 3$             |      |       |
| CrAx            | Cross axis                                 |  | -3.5 |                     | 3.5  | %     |
| V <sub>st</sub> | Self test output change <sup>(7),(8)</sup> | Full-scale= $\pm 2$ g<br>X axis  | 250  | 550                 | 900  | LSb   |
|                 |  | Full-scale= $\pm 2$ g<br>Y axis  | 250  | 550                 | 900  | LSb   |
|                 |  | Full-scale= $\pm 2$ g<br>Z axis  | -100 | -350                | -600 | LSb   |
|                 |  | Full-scale= $\pm 6$ g<br>X axis  | 80   | 180                 | 300  | LSb   |
|                 |  | Full-scale= $\pm 6$ g<br>Y axis  | 80   | 180                 | 300  | LSb   |
|                 |  | Full-scale= $\pm 6$ g<br>Z axis  | -30  | -120                | -200 | LSb   |
| BW              | System Bandwidth <sup>(9)</sup>            |  |      | ODRx/4              |      | Hz    |
| Top             | Operating Temperature Range                |  | -40  |                     | +85  | °C    |
| Wh              | Product Weight                             |  |      | 72                  |      | mgram |

1. The product is factory calibrated at 3.3 V. The device can be used from 2.16 V to 3.6 V
2. Typical specifications are not guaranteed
3. Verified by wafer level test and specification of initial offset and sensitivity
4. Zero-g level offset value after MSL3 preconditioning
5. Offset can be eliminated by enabling the built-in high pass filter (HPF)
6. Results of accelerated reliability tests
7. Self Test output changes with the power supply. "Self test output change" is defined as  $\text{OUTPUT}[\text{LSb}]_{(\text{Self-test bit on ctrl\_reg1=1})} - \text{OUTPUT}[\text{LSb}]_{(\text{Self-test bit on ctrl\_reg1=0})}$ . 1LSb=1g/1024 at 12bit representation, 2g Full-Scale
8. Output data reach 99% of final value after 5/ODR when enabling Self-Test mode due to device filtering
9. ODRx is output data rate. Refer to [Table 5](#) for specifications

Table 4. Mechanical characteristics @ Vdd=2.5 V, T=25 °C unless otherwise noted<sup>(1)</sup>

| Symbol | Parameter   | Test conditions                           | Min. | Typ. <sup>(2)</sup> | Max. | Unit  |
|--------|---|---|------|---------------------|------|-------|
| FS     | Measurement range <sup>(3)</sup>                      | FS bit set to 0                           | ±1.7 | ±2.0                |      | g     |
|        |   | FS bit set to 1                           | ±5.3 | ±6.0                |      |       |
| Dres   | Device resolution                                     | Full-scale = ±2g<br>ODR1=40Hz             |      | 1.0                 |      | mg    |
|        |   | Full-scale = ±2g<br>ODR2=160Hz            |      | 2.0                 |      |       |
|        |   | Full-scale = ±2g<br>ODR3=640Hz            |      | 3.9                 |      |       |
|        |   | Full-scale = ±2g<br>ODR4=2560Hz           |      | 15.6                |      |       |
| So     | Sensitivity   | Full-scale = ±2g<br>12 bit representation | 920  | 1024                | 1126 | LSb/g |
|        |   | Full-scale = ±6g<br>12 bit representation | 306  | 340                 | 374  |       |
| TCSO   | Sensitivity change vs temperature                     | Full-scale = ±2g<br>12 bit representation |      | 0.025               |      | %/°C  |

| VIL    | Digital Low level Input voltage        |                  |            |                     | 0.2*Vdd_IO |      |
| VOH    | High level output voltage              |                  | 0.9*Vdd_IO |                     |            | V    |
| VOL    | Low level output voltage               |                  |            |                     | 0.1*Vdd_IO |      |
| ODR1   | Output Data Rate 1                     | Dec factor = 512 |            | 40                  |            | Hz   |
| ODR2   | Output Data Rate 2                     | Dec factor = 128 |            | 160                 |            |      |
| ODR3   | Output Data Rate 3                     | Dec factor = 32  |            | 640                 |            |      |
| ODR4   | Output Data Rate 4                     | Dec factor = 8   |            | 2560                |            |      |
| BW     | System bandwidth <sup>(3)</sup>        |                  |            | ODRx/4              |            | Hz   |
| Ton    | Turn-on time <sup>(4)</sup>            |                  |            | 5/ODRx              |            | s    |
| Top    | Operating temperature range            |                  | -40        |                     | +85        | °C   |

1. The product is factory calibrated at 3.3 V. The device can be used from 2.16 V to 3.6 V

2. Typical specifications are not guaranteed

3. Digital filter cut-off frequency

4. Time to obtain valid data after exiting Power-Down mode

## 2.3 Communication interface characteristics

### 2.3.1 SPI - serial peripheral interface

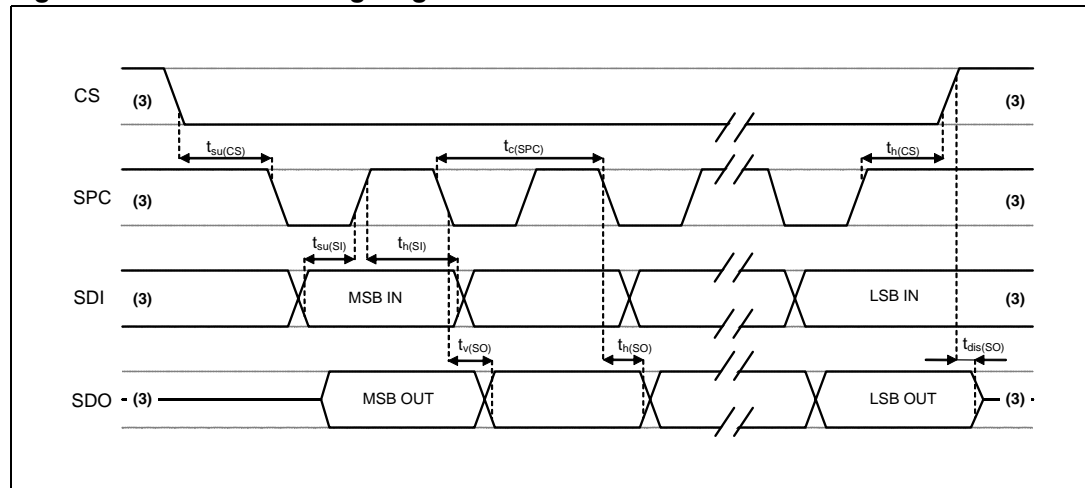

Subject to general operating conditions for Vdd and Top.

**Table 6. SPI Slave Timing Values**

| Symbol   | Parameter               | Value <sup>(1)</sup> |     | Unit |
|----------|-------------------------|----------------------|-----|------|
|          |                         | Min                  | Max |      |
| tc(SPC)  | SPI clock cycle         | 125                  |     | ns   |
| fc(SPC)  | SPI clock frequency     |                      | 8   | MHz  |
| tsu(CS)  | CS setup time           | 5                    |     | ns   |
| th(CS)   | CS hold time            | 10                   |     |      |

1. Data based on standard I<sup>2</sup>C protocol requirement, not tested in production
2. A device must internally provide an hold time of at least 300ns for the SDA signal (referred to VIHmin of the SCL signal) to bridge the undefined region of the falling edge of SCL
3.  $C_b$  = total capacitance of one bus line, in pF

**Figure 4. I<sup>2</sup>C slave timing diagram <sup>(4)</sup>**

4.Measurement points are done at 0.2·Vdd\_IO and 0.8·Vdd\_IO, for both port

## 2.4 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Table 8. Absolute maximum ratings**

| Symbol             | Ratings  | Maximum Value                   | Unit |
|--------------------|--|---------------------------------|------|
| V <sub>DD</sub>    | Supply voltage   | -0.3 to 6                       | V    |
| V <sub>DD_IO</sub> | I/O pins Supply voltage  | -0.3 to V <sub>DD</sub> +0.1    | V    |
| V <sub>IN</sub>    | Input voltage on any control pin<br>(CS, SCL/SPC, SDA/SDI/SDO, CK) | -0.3 to V <sub>DD_IO</sub> +0.3 | V    |
| A <sub>POW</sub>   | Acceleration (Any axis, Powered, V <sub>DD</sub> =3.3 V)           | 3000g for 0.5 ms                |      |
|                    |  | 10000g for 0.1 ms               |      |
| A <sub>UNP</sub>   | Acceleration (any axis, unpowered)                                 | 3000g for 0.5 ms                |      |
|                    |  | 10000g for 0.1 ms               |      |
| T <sub>OP</sub>    | Operating temperature range  | -40 to +85                      | °C   |
| T <sub>STG</sub>   | Storage temperature range  | -40 to +125                     | °C   |
| ESD                | Electrostatic discharge protection                                 | 4.0 (HBM)                       | kV   |
|                    |  | 200 (MM)                        | V    |
|                    |  | 1.5 (CDM)                       | kV   |

*Note:* Supply voltage on any pin should never exceed 6.0 V.

This is a Mechanical Shock sensitive device, improper handling can cause permanent damages to the part

This is an ESD sensitive device, improper handling can cause permanent damages to the part

## 2.5 Terminology

### 2.5.1 Sensitivity

Sensitivity describes the gain of the sensor and can be determined e.g. by applying 1g acceleration to it. As the sensor can measure DC accelerations this can be done easily by pointing the axis of interest towards the center of the Earth, noting the output value, rotating the sensor by 180 degrees (point to the sky) and noting the output value again. By doing so,  $\pm 1g$  acceleration is applied to the sensor. Subtracting the larger output value from the smaller one and dividing the result by 2 leads to the actual sensitivity of the sensor. This value changes very little over temperature and also very little over time. The Sensitivity Tolerance describes the range of Sensitivities of a large population of sensors.

### 2.5.2 Zero-g level

Zero-g level Offset (Off) describes the deviation of an actual output signal from the ideal output signal if there is no acceleration present. A sensor in a steady state on a horizontal surface will measure 0g in X axis and 0g in Y axis whereas the Z axis will measure 1g. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, 00h with 16 bit representation, data expressed as 2's complement number). A deviation from ideal value in this case is called Zero-g offset. Offset is to some extent a result of stress to a precise MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Zero-g level change vs. temperature". The Zero-g level of an individual sensor is stable over lifetime. The Zero-g level tolerance describes the range of Zero-g levels of a population of sensors.

### 2.5.3 Self test

Self Test allows to test the mechanical and electric part of the sensor, allowing the seismic mass to be moved by means of an electrostatic test-force. The Self Test function is off when the self-test bit of CTRL\_REG1 (control register 1) is programmed to '0'. When the self-test bit of CTRL\_REG1 is programmed to '1' an actuation force is applied to the sensor, simulating a definite input acceleration. In this case the sensor outputs will exhibit a change in their DC levels which is related to the selected full scale and depending on the Supply Voltage through the device sensitivity. When Self Test is activated, the device output level is given by the algebraic sum of the signals produced by the acceleration acting on the sensor and by the electrostatic test-force. If the output signals change within the amplitude specified inside [Table 3](#) or [4](#) then the sensor is working properly and the parameters of the interface chip are within the defined specification.

## 3 Functionality

The LIS3LV02DL is a high performance, low-power, digital output 3-axis linear accelerometer packaged in an LGA package. The complete device includes a sensing element and an IC interface able to take the information from the sensing element and to provide a signal to the external world through an I<sup>2</sup>C/SPI serial interface.

### 3.1 Sensing element

A proprietary process is used to create a surface micro-machined accelerometer. The technology allows to carry out suspended silicon structures which are attached to the substrate in a few points called anchors and are free to move in the direction of the sensed acceleration. To be compatible with the traditional packaging techniques a cap is placed on top of the sensing element to avoid blocking the moving parts during the moulding phase of the plastic encapsulation.

When an acceleration is applied to the sensor the proof mass displaces from its nominal position, causing an imbalance in the capacitive half-bridge. This imbalance is measured using charge integration in response to a voltage pulse applied to the sense capacitor.

At steady state the nominal value of the capacitors are few pF and when an acceleration is applied the maximum variation of the capacitive load is up to 100fF.

### 3.2 IC interface

The complete measurement chain is composed by a low-noise capacitive amplifier which converts into an analog voltage the capacitive unbalancing of the MEMS sensor and by three  $\Sigma\Delta$  analog-to-digital converters, one for each axis, that translate the produced signal into a digital bitstream.

The  $\Sigma\Delta$  converters are coupled with dedicated reconstruction filters which remove the high frequency components of the quantization noise and provide low rate and high resolution digital words.

The charge amplifier and the  $\Sigma\Delta$  converters are operated respectively at 61.5 kHz and 20.5 kHz.

The data rate at the output of the reconstruction depends on the user selected Decimation Factor (DF) and spans from 40 Hz to 2560 Hz.

The acceleration data may be accessed through an I<sup>2</sup>C/SPI interface thus making the device particularly suitable for direct interfacing with a microcontroller.

The LIS3LV02DL features a Data-Ready signal (RDY) which indicates when a new set of measured acceleration data is available thus simplifying data synchronization in digital system employing the device itself.

The LIS3LV02DL may also be configured to generate an inertial Wake-Up, Direction Detection and Free-Fall interrupt signal accordingly to a programmed acceleration event along the enabled axes.

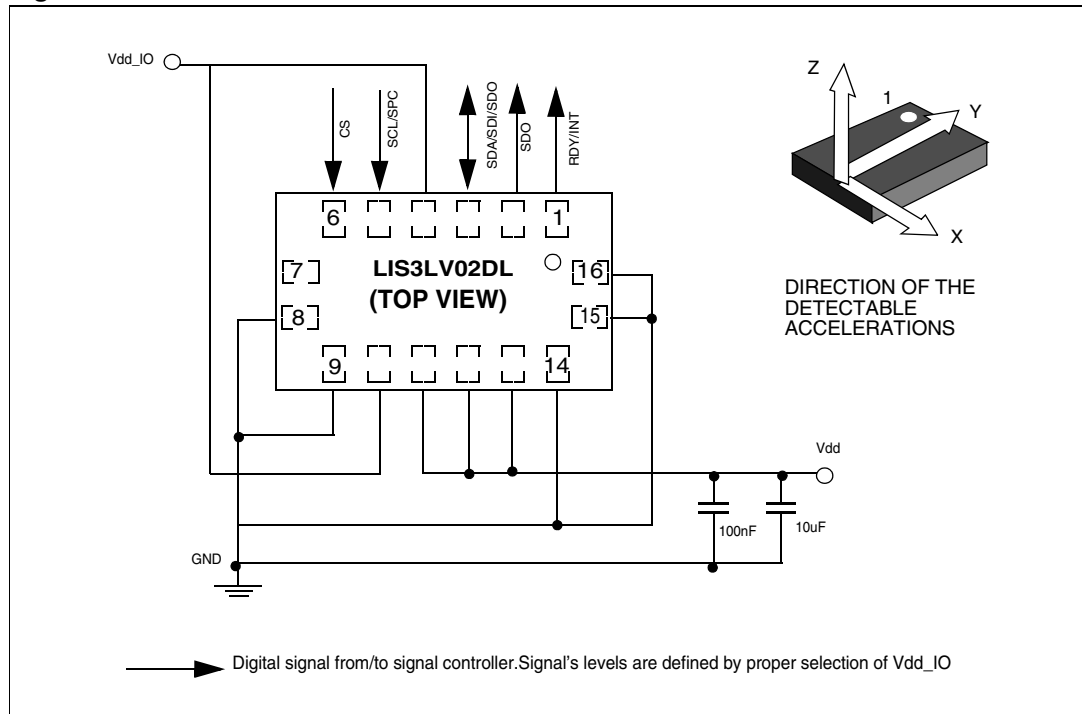

### 3.3 Factory calibration

The IC interface is factory calibrated for sensitivity (So) and Zero-g level (Off).

The trimming values are stored inside the device by a non volatile structure. Any time the device is turned on, the trimming parameters are downloaded into the registers to be employed during the normal operation. This allows the user to employ the device without further calibration.

## 4 Application hints

Figure 5. LIS3LV02DL electrical connection

The device core is supplied through Vdd line while the I/O pads are supplied through Vdd\_IO line. Power supply decoupling capacitors (100 nF ceramic, 10  $\mu$ F Al) should be placed as near as possible to the pin 13 of the device (common design practice).

All the voltage and ground supplies must be present at the same time to have proper behavior of the IC (refer to [Figure 7](#)). It is possible to remove Vdd maintaining Vdd\_IO without blocking the communication busses. In this condition the measurement chain is powered off.

The functionality of the device and the measured acceleration data is selectable and accessible through the I<sup>2</sup>C/SPI interface. When using the I<sup>2</sup>C, CS must be tied high while SDO must be left floating. Refer to dedicated application note for further information on device usage.

The functions, the thresholds and the timing of the interrupt pin (INT) can be completely programmed by the user through the I<sup>2</sup>C/SPI interface.

### 4.1 Soldering Information

The LGA-16 package is compliant with the ECOPACK<sup>®</sup>, RoHS and “Green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020C.

Leave “Pin 1 Indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at [www.st.com/mems](http://www.st.com/mems).

## 5 Digital interfaces

The registers embedded inside the LIS3LV02DL may be accessed through both the I<sup>2</sup>C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped onto the same pads. To select/exploit the I<sup>2</sup>C interface, CS line must be tied high (i.e connected to Vdd\_IO).

**Table 9. Serial interface pin description**

| Pin name    | Pin description  |
|-------------|--|
| CS          | SPI enable<br>I <sup>2</sup> C/SPI mode selection (1: I <sup>2</sup> C mode; 0: SPI enabled)                   |
| SCL/SPC     | I <sup>2</sup> C Serial Clock (SCL)<br>SPI Serial Port Clock (SPC)   |
| SDA/SDI/SDO | I <sup>2</sup> C Serial Data (SDA)<br>SPI Serial Data Input (SDI)<br>3-wire Interface Serial Data Output (SDO) |
| SDO         | SPI Serial Data Output (SDO)   |

### 5.1 I<sup>2</sup>C serial interface

The LIS3LV02DL I<sup>2</sup>C is a bus slave. The I<sup>2</sup>C is employed to write the data into the registers whose content can also be read back.

The relevant I<sup>2</sup>C terminology is given in the table below.

**Table 10. Serial interface pin description**

| Term        | Description  |
|-------------|--|
| Transmitter | The device which sends data to the bus   |
| Receiver    | The device which receives data from the bus  |
| Master      | The device which initiates a transfer, generates clock signals and terminates a transfer |
| Slave       | The device addressed by the master   |

There are two signals associated with the I<sup>2</sup>C bus: the Serial Clock Line (SCL) and the Serial Data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines are connected to Vdd\_IO through a pull-up resistor embedded inside the LIS3LV02DL. When the bus is free both the lines are high.

The I<sup>2</sup>C interface is compliant with Fast Mode (400 kHz) I<sup>2</sup>C standards as well as the Normal Mode.

### 5.1.1 I<sup>2</sup>C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a HIGH to LOW transition on the data line while the SCL line is held HIGH. After this has been transmitted by the Master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the Master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the Master. The Slave Address (SAD) associated to the LIS3LV02DL is 0011101b.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I<sup>2</sup>C embedded inside the LIS3LV02DL behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, a 8-bit sub-address will be transmitted: the 7 LSb represent the actual register address while the MSB enables address auto increment. If the MSb of the SUB field is 1, the SUB (register address) will be automatically incremented to allow multiple data read/write.

The slave address is completed with a Read/Write bit. If the bit was '1' (Read), a repeated START (SR) condition will have to be issued after the two sub-address bytes; if the bit is '0' (Write) the Master will transmit to the slave with direction unchanged.

**Table 11. Transfer when master is writing one byte to slave**

|        |    |         |     |     |     |      |     |    |
|--------|----|---------|-----|-----|-----|------|-----|----|
| Master | ST | SAD + W |     | SUB |     | DATA |     | SP |
| Slave  |    |         | SAK |     | SAK |      | SAK |    |

**Table 12. Transfer when master is writing multiple bytes to slave**

|        |    |         |     |     |     |      |     |      |     |    |
|--------|----|---------|-----|-----|-----|------|-----|------|-----|----|
| Master | ST | SAD + W |     | SUB |     | DATA |     | DATA |     | SP |
| Slave  |    |         | SAK |     | SAK |      | SAK |      | SAK |    |

**Table 13. Transfer when master is receiving (reading) one byte of data from slave**

|        |    |         |     |     |     |    |         |     |      |      |    |
|--------|----|---------|-----|-----|-----|----|---------|-----|------|------|----|
| Master | ST | SAD + W |     | SUB |     | SR | SAD + R |     |      | NMAK | SP |
| Slave  |    |         | SAK |     | SAK |    |         | SAK | DATA |      |    |

**Table 14. Transfer when master is receiving (reading) multiple bytes of data from slave**

|        |    |       |     |     |     |    |       |     |      |  |      |  |      |    |
|--------|----|-------|-----|-----|-----|----|-------|-----|------|--|------|--|------|----|
| Master | ST | SAD+W |     | SUB |     | SR | SAD+R |     | MAK  |  | MAK  |  | NMAK | SP |
| Slave  |    |       | SAK |     | SAK |    |       | SAK | DATA |  | DATA |  | DATA |    |

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. DATA is transferred with the Most Significant bit (MSb) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL LOW to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real time function) the data line must be left HIGH by the slave. The Master can then abort the transfer. A LOW to HIGH transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to '1' while SUB(6-0) represents the address of first register to read.

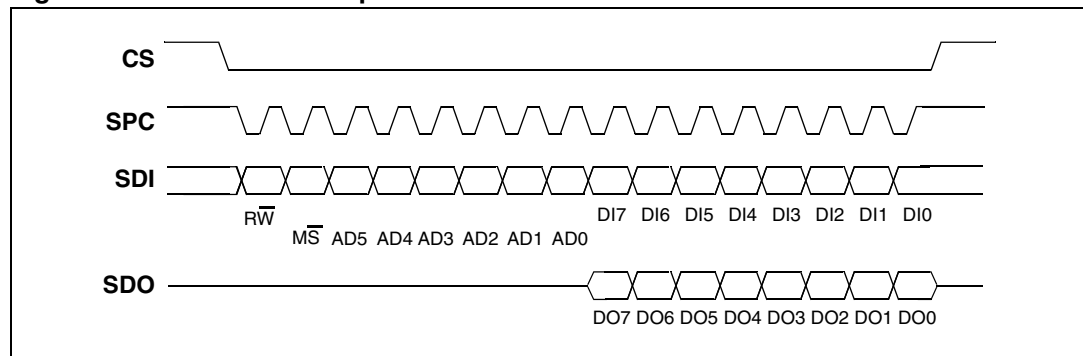

In the presented communication format MAK is Master Acknowledge and NMAK is No Master Acknowledge.

## 5.2 SPI bus interface

The LIS3LV02DL SPI is a bus slave. The SPI allows to write and read the registers of the device.

The serial interface interacts with the outside world with 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

**Figure 6. Read and write protocol**

**CS** is the Serial Port Enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end.

**SPC** is the Serial Port Clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission).

**SDI** and **SDO** are respectively the Serial Port Data Input and Output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the Read Register and Write Register commands are completed in 16 clock pulses or in multiple of 8 in case of multiple byte read/write. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of SPC just before the rising edge of **CS**.

**bit 0:**  $\overline{RW}$  bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In latter case, the chip will drive **SDO** at the start of bit 8.

**bit 1:**  $\overline{MS}$  bit. When 0, the address will remain unchanged in multiple read/write commands. When 1, the address will be auto incremented in multiple read/write commands.

**bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DI(7:0) (write mode). This is the data that will be written into the device (MSb first).

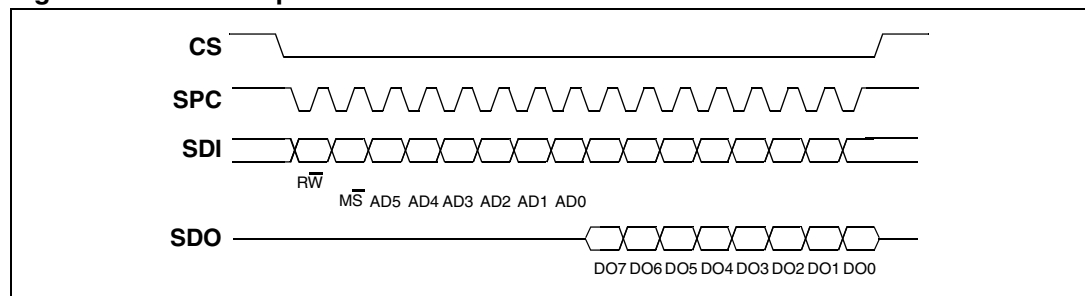

**bit 8-15:** data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods will be added. When  $\overline{MS}$  bit is 0 the address used to read/write data remains the same for every block. When  $\overline{MS}$  bit is '1' the address used to read/write data is incremented at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

### 5.2.1 SPI read

Figure 7. SPI read protocol

The SPI Read command is performed with 16 clock pulses. Multiple byte read command is performed adding blocks of 8 clock pulses at the previous one.

**bit 0:** READ bit. The value is 1.

**bit 1:**  $\overline{MS}$  bit. When 0 do not increment address, when 1 increment address in multiple reading.

**bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

**bit 16-...** : data DO(...-8). Further data in multiple byte reading.

**Figure 8. Multiple bytes SPI read protocol (2 bytes example)**

### 5.2.2 SPI write

**Figure 9. SPI write protocol**

The SPI Write command is performed with 16 clock pulses. Multiple byte write command is performed adding blocks of 8 clock pulses at the previous one.

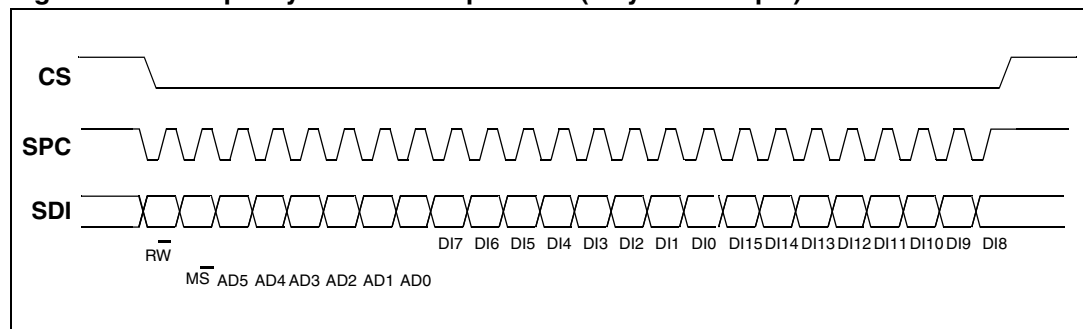

**bit 0:** WRITE bit. The value is 0.

**bit 1:**  $\overline{MS}$  bit. When 0 do not increment address, when 1 increment address in multiple writing.

**bit 2 -7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DI(7:0) (write mode). This is the data that will be written inside the device (MSb first).

**bit 16-...** : data DI(...-8). Further data in multiple byte writing.

**Figure 10. Multiple bytes SPI write protocol (2 bytes example)**

### 5.2.3 SPI Read in 3-wires mode

3-wires mode is entered by setting to '1' bit SIM (SPI Serial Interface Mode selection) in CTRL\_REG2.

**Figure 11. SPI read protocol in 3-wires mode**

The SPI Read command is performed with 16 clock pulses:

**bit 0:** READ bit. The value is 1.

**bit 1:**  $\overline{MS}$  bit. When 0 do not increment address, when 1 increment address in multiple reading.

**bit 2-7:** address AD(5:0). This is the address field of the indexed register.

**bit 8-15:** data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

Multiple read command is also available in 3-wires mode.

## 6 Register mapping

The table given below provides a listing of the 8 bit registers embedded in the device and the related addresses.

**Table 15. Registers address map**

| Register name   | Type | Register address  |         | Default     | Comment        |
|-----------------|------|-------------------|---------|-------------|----------------|

Registers marked as *Reserved* must not be changed. The writing to those registers may cause permanent damages to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered-up.

## 7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve acceleration data. The registers 7.2 to 7.7 contain the factory calibration values, it is not necessary to change their value for normal device operation.

### 7.1 WHO\_AM\_I (0Fh)

**Table 16. Register (0Fh)**

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| W7 | W6 | W5 | W4 | W3 | W2 | W1 | W0 |
|----|----|----|----|----|----|----|----|

**Table 17. Register description (0Fh)**

|        |  |
|--------|--|
| W7, W0 | LIS3LV02DL Physical Address equal to 3Ah |
|--------|--|

Addressing this register the physical address of the device is returned. For LIS3LV02DL the physical address assigned in factory is 3Ah.

### 7.2 OFFSET\_X (16h)

**Table 18. Register (16h)**

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| OX7 | OX6 | OX5 | OX4 | OX3 | OX2 | OX1 | OX0 |
|-----|-----|-----|-----|-----|-----|-----|-----|

**Table 19. Register description (16h)**

|-----|-----|-----|-----|-----|-----|-----|-----|

**Table 29. Register description (1Bh)**

|          |                                  |
|----------|----------------------------------|
| GZ7, GZ0 | Digital Gain Trimming for Z-Axis |
|----------|----------------------------------|

## 7.8 CTRL\_REG1 (20h)

**Table 30. Register (20h)**

|     |     |     |     |    |     |     |     |
|-----|-----|-----|-----|----|-----|-----|-----|
| PD1 | PD0 | DF1 | DF0 | ST | Zen | Yen | Xen |
|-----|-----|-----|-----|----|-----|-----|-----|

**Table 31. Register description (20h)**

|          |  |
|----------|--|
| PD1, PD0 | Power Down Control<br>(00: power-down mode; 01, 10, 11: device on)   |
| DF1, DF0 | Decimation Factor Control<br>(00: decimate by 512; 01: decimate by 128; 10: decimate by 32; 11: decimate by 8) |

**Table 31. Register description (continued) (20h)**

|     |   |
|-----|---|
| ST  | Self Test Enable<br>(0: normal mode; 1: self-test active) |
| Zen | Z-axis enable<br>(0: axis off; 1: axis on)                |
| Yen | Y-axis enable<br>(0: axis off; 1: axis on)                |
| Xen | X-axis enable<br>(0: axis off; 1: axis on)                |

**PD1, PD0** bit allows to turn the device out of power-down mode. The device is in power-down mode when PD1, PD0= "00" (default value after boot). The device is in normal mode when either PD1 or PD0 is set to 1.

**DF1, DF0** bit allows to select the data rate at which acceleration samples are produced. The default value is "00" which corresponds to a data-rate of 40 Hz. By changing the content of DF1, DF0 to "01", "10" and "11" the selected data-rate will be set respectively equal to 160 Hz, 640 Hz and to 2560 Hz.

**ST** bit is used to activate the self test function. When the bit is set to one, an output change will occur to the device outputs (refer to table 2 and 3 for specification) thus allowing to check the functionality of the whole measurement chain.

**Zen** bit enables the Z-axis measurement channel when set to 1. The default value is 1.

**Yen** bit enables the Y-axis measurement channel when set to 1. The default value is 1.

**Xen** bit enables the X-axis measurement channel when set to 1. The default value is 1.

## 7.9 CTRL\_REG2 (21h)

**Table 32. Register (21h)**

|    |     |     |      |     |      |     |     |
|----|-----|-----|------|-----|------|-----|-----|
| FS | BDU | BLE | BOOT | IEN | DRDY | SIM | DAS |
|----|-----|-----|------|-----|------|-----|-----|

**Table 33. Register description (21h)**

|      |  |
|------|--|
| FS   | Full Scale selection<br>(0: $\pm 2g$ ; 1: $\pm 6g$ )   |
| BDU  | Block Data Update<br>(0: continuous update; 1: output registers not updated between MSB and LSB reading) |
| BLE  | Big/Little Endian selection<br>(0: little endian; 1: big endian)   |
| BOOT | Reboot memory content  |
| IEN  | Interrupt ENable<br>(0: data ready on RDY pad; 1: interrupt events on RDY pad)                           |
| DRDY | Enable Data-Ready generation   |

**Table 33. Register description (continued) (21h)**

|     |   |
|-----|---|
| SIM | SPI Serial Interface Mode selection<br>(0: 4-wire interface; 1: 3-wire interface) |
| DAS | Data Alignment Selection<br>(0: 12 bit right justified; 1: 16 bit left justified) |

**FS** bit is used to select Full Scale value. After the device power-up the default full scale value is  $\pm 2g$ . In order to obtain a  $\pm 6g$  full scale it is necessary to set FS bit to '1'.

**BDU** bit is used to inhibit output registers update between the reading of upper and lower register parts. In default mode (BDU = '0') the lower and upper register parts are updated continuously. If it is not sure to read faster than output data rate, it is recommended to set BDU bit to '1'. In this way, after the reading of the lower (upper) register part, the content of that output registers is not updated until the upper (lower) part is read too. This feature avoids reading LSB and MSB related to different samples.

**BLE** bit is used to select Big Endian or Little Endian representation for output registers. In Big Endian's one MSB acceleration value is located at addresses 28h (X-axis), 2Ah (Y-axis) and 2Ch (Z-axis) while LSB acceleration value is located at addresses 29h (X-axis), 2Bh (Y-axis) and 2Dh (Z-axis). In Little Endian representation (Default, BLE='0') the order is inverted (refer to data register description for more details).

**BOOT** bit is used to refresh the content of internal registers stored in the flash memory block. At the device power up the content of the flash memory block is transferred to the internal registers related to trimming functions to permit a good behavior of the device itself. If for any reason the content of trimming registers was changed it is sufficient to use this bit to restore correct values. When BOOT bit is set to '1' the content of internal flash is copied inside corresponding internal registers and it is used to calibrate the device. These values are factory trimmed and they are different for every accelerometer. They permit a good behavior of the device and normally they have not to be changed. At the end of the boot process the BOOT bit is set again to '0'.

**IEN** bit is used to switch the value present on data-ready pad between Data-Ready signal and Interrupt signal. At power up the Data-ready signal is chosen. It is however necessary to modify DRDY bit to enable Data-Ready signal generation.

**DRDY** bit is used to enable Data-Ready (RDY/INT) pin activation. If DRDY bit is '0' (default value) on Data-Ready pad a '0' value is present. If a Data-Ready signal is desired it is necessary to set to '1' DRDY bit. Data-Ready signal goes to '1' whenever a new data is available for all the enabled axis. For example if Z-axis is disabled, Data-Ready signal goes to '1' when new values are available for both X and Y axis. Data-Ready signal comes back to '0' when all the registers containing values of the enabled axis are read. To be sure not to loose any data coming from the accelerometer data registers must be read before a new Data-Ready rising edge is generated. In this case Data-ready signal will have the same frequency of the data rate chosen.

**SIM** bit selects the SPI Serial Interface Mode. When SIM is '0' (default value) the 4-wire interface mode is selected. The data coming from the device are sent to SDO pad. In 3-wire interface mode output data are sent to SDA/SDI pad.

**DAS** bit permits to decide between 12 bit right justified and 16 bit left justified representation of data coming from the device. The first case is the default case and the most significant bits are replaced by the bit representing the sign.

## 7.10 CTRL\_REG3 (22h)

**Table 34. Register (22h)**

|     |      |      |     |     |     |      |      |
|-----|------|------|-----|-----|-----|------|------|
| ECK | HPDD | HPFF | FDS | res | res | CFS1 | CFS0 |
|-----|------|------|-----|-----|-----|------|------|

**Table 35. Register description (22h)**

|            |  |
|------------|--|
| ECK        | External Clock. Default value: 0<br>(0: clock from internal oscillator; 1: clock from external pad)                              |
| HPDD       | High Pass filter enabled for Direction Detection. Default value: 0<br>(0: filter bypassed; 1: filter enabled)                    |
| HPFF       | High Pass filter enabled for Free-Fall and Wake-Up. Default value: 0<br>(0: filter bypassed; 1: filter enabled)                  |
| FDS        | Filtered Data Selection. Default value: 0<br>(0: internal filter bypassed; 1: data from internal filter)                         |
| CFS1, CFS0 | High-pass filter Cut-off Frequency Selection. Default value: 00<br>(00: Hpc=512<br>01: Hpc=1024<br>10: Hpc=2048<br>11: Hpc=4096) |

**FDS** bit enables (FDS=1) or bypass (FDS=0) the high pass filter in the signal chain of the sensor.

**CFS1, CFS0** bits defines the coefficient Hpc to be used to calculate the -3dB cut-off frequency of the high pass filter:

$$f_{\text{cutoff}} = \frac{0.318}{H_{\text{pc}}} \cdot \frac{\text{ODRx}}{2}$$

## 7.11 HP\_FILTER\_RESET (23h)

Dummy register. Reading at this address zeroes instantaneously the content of the internal high pass-filter. Read data is not significant.

## 7.12 STATUS\_REG (27h)

**Table 36. Register (27h)**

|       |     |     |     |       |     |     |     |
|-------|-----|-----|-----|-------|-----|-----|-----|
| ZYXOR | ZOR | YOR | XOR | ZYXDA | ZDA | YDA | XDA |
|-------|-----|-----|-----|-------|-----|-----|-----|

**Table 37. Register description (27h)**

|       |                              |
|-------|------------------------------|
| ZYXOR | X, Y and Z axis Data Overrun |
| ZOR   | Z axis Data Overrun          |
| YOR   | Y axis Data Overrun          |
| XOR   | X axis Data Overrun          |

**Table 37. Register description (continued) (27h)**

|       |                                    |
|-------|------------------------------------|
| ZYXDA | X, Y and Z axis new Data Available |
| ZDA   | Z axis new Data Available          |
| YDA   | Y axis new Data Available          |
| XDA   | X axis new Data Available          |

The content of this register is updated every ODR cycle, regardless of BDU bit value in CTRL\_REG2.

## 7.13 OUTX\_L (28h)

|----------|------------------------------|
| XD7, XD0 | X axis acceleration data LSB |
|----------|------------------------------|

In Big Endian Mode (bit BLE in CTRL\_REG2 set to '1') the content of this register is the MSB acceleration data and depends on bit DAS in CTRL\_REG2 register as described in the following section.

## 7.14 OUTX\_H (29h)

**Table 40. Register (29h)**

|      |      |      |      |      |      |     |     |
|------|------|------|------|------|------|-----|-----|
| XD15 | XD14 | XD13 | XD12 | XD11 | XD10 | XD9 | XD8 |
|------|------|------|------|------|------|-----|-----|

**Table 41. Register description (29h)**

|           |                              |
|-----------|------------------------------|
| XD15, XD8 | X axis acceleration data MSB |
|-----------|------------------------------|

When reading the register in "12 bit right justified" mode the most significant bits (15:12) are replaced with bit 11 (i.e. XD15-XD12=XD11, XD11, XD11, XD11).

In Big Endian Mode (bit BLE in CTRL\_REG2 set to '1') the content of this register is the LSB acceleration data.

## 7.15 OUTY\_L (2Ah)

**Table 42. Register (2Ah)**

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| YD7 | YD6 | YD5 | YD4 | YD3 | YD2 | YD1 | YD0 |
|-----|-----|-----|-----|-----|-----|-----|-----|

**Table 43. Register description (2Ah)**

|          |                              |
|----------|------------------------------|
| YD7, YD0 | Y axis acceleration data LSB |
|----------|------------------------------|

In Big Endian Mode (bit BLE in CTRL\_REG2 set to '1') the content of this register is the MSB acceleration data and depends on bit DAS in CTRL\_REG2 register as described in the following section.

## 7.16 OUTY\_H (2Bh)

**Table 44. Register (2Bh)**

|      |      |      |      |      |      |     |     |
|------|------|------|------|------|------|-----|-----|
| YD15 | YD14 | YD13 | YD12 | YD11 | YD10 | YD9 | YD8 |
|------|------|------|------|------|------|-----|-----|

**Table 45. Register description (2Bh)**

|           |                              |
|-----------|------------------------------|
| YD15, YD8 | Y axis acceleration data MSB |
|-----------|------------------------------|

When reading the register in "12 bit right justified" mode the most significant bits (15:12) are replaced with bit 11 (i.e. YD15-YD12=YD11, YD11, YD11, YD11).

In Big Endian Mode (bit BLE in CTRL\_REG2 set to '1') the content of this register is the LSB acceleration data.

## 7.17 OUTZ\_L (2Ch)

**Table 46. Register (2Ch)**

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| ZD7 | ZD6 | ZD5 | ZD4 | ZD3 | ZD2 | ZD1 | ZD0 |
|-----|-----|-----|-----|-----|-----|-----|-----|

**Table 47. Register description (2Ch)**

|          |                              |
|----------|------------------------------|
| ZD7, ZD0 | Z axis acceleration data LSB |
|----------|------------------------------|

In Big Endian Mode (bit BLE in CTRL\_REG2 set to '1') the content of this register is the MSB acceleration data and depends on bit DAS in CTRL\_REG2 register as described in the following section.

## 7.18 OUTZ\_H (2Dh)

**Table 48. Register (2Dh)**

|      |      |      |      |      |      |     |     |
|------|------|------|------|------|------|-----|-----|
| ZD15 | ZD14 | ZD13 | ZD12 | ZD11 | ZD10 | ZD9 | ZD8 |
|------|------|------|------|------|------|-----|-----|

**Table 49. Register description (2Dh)**

|           |                              |
|-----------|------------------------------|
| ZD15, ZD8 | Z axis acceleration data MSB |
|-----------|------------------------------|

When reading the register in "12 bit right justified" mode the most significant bits (15:12) are replaced with bit 11 (i.e. ZD15-ZD12=ZD11, ZD11, ZD11, ZD11).

In Big Endian Mode (bit BLE in CTRL\_REG2 set to '1') the content of this register is the LSB acceleration data.

## 7.19 FF\_WU\_CFG (30h)

**Table 50. Register (30h)**

|     |     |      |      |      |      |      |      |
|-----|-----|------|------|------|------|------|------|
| AOI | LIR | ZHIE | ZLIE | YHIE | YLIE | XHIE | XLIE |
|-----|-----|------|------|------|------|------|------|

**Table 51. Register description (30h)**

|      |   |
|------|---|
| AOI  | And/Or combination of Interrupt events. Default value: 0.<br>(0: OR combination of interrupt events;<br>1: AND combination of interrupt events)                                     |
| LIR  | Latch interrupt request. Default value: 0.<br>(0: interrupt request not latched;<br>1: interrupt request latched)   |
| ZHIE | Enable Interrupt request on Z High event. Default value: 0.<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value higher than preset threshold) |
| ZLIE | Enable Interrupt request on Z Low event. Default value: 0.<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value lower than preset threshold)   |
| YHIE | Enable Interrupt request on Y High event. Default value: 0.<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value higher than preset threshold) |
| YLIE | Enable Interrupt request on Y Low event. Default value: 0.<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value lower than preset threshold)   |
| XHIE | Enable Interrupt request on X High event. Default value: 0.<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value higher than preset threshold) |
| XLIE | Enable Interrupt request on X Low event. Default value: 0.<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value lower than preset threshold)   |

Free-fall and inertial wake-up configuration register.

## 7.20 FF\_WU\_SRC (31h)

**Table 52. Register (31h)**

|   |    |    |    |    |    |    |    |
|---|----|----|----|----|----|----|----|
| X | IA | ZH | ZL | YH | YL | XH | XL |
|---|----|----|----|----|----|----|----|

**Table 53. Register description (31h)**

|    |  |
|----|--|
| IA | Interrupt Active. Default value: 0<br>(0: no interrupt has been generated;<br>1: one or more interrupt events have been generated) |
| ZH | Z High. Default value: 0<br>(0: no interrupt; 1: Z High event has occurred)  |
| ZL | Z Low. Default value: 0<br>(0: no interrupt; 1: Z Low event has occurred)  |
| YH | Y High. Default value: 0<br>(0: no interrupt; 1: Y High event has occurred)  |
| YL | Y Low. Default value: 0<br>(0: no interrupt; 1: Y Low event has occurred)  |
| XH | X High. Default value: 0<br>(0: no interrupt; 1: X High event has occurred)  |
| XL | X Low. Default value: 0<br>(0: no interrupt; 1: X Low event has occurred)  |

## 7.21 FF\_WU\_ACK (32h)

Dummy register. If LIR bit in FF\_WU\_CFG register is set to '1', a reading at this address allows the FF\_WU\_SRC register refresh. Read data is not significant.

## 7.22 FF\_WU\_THS\_L (34h)

**Table 54. Register (34h)**

|      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|
| THS7 | THS6 | THS5 | THS4 | THS3 | THS2 | THS1 | THS0 |
|------|------|------|------|------|------|------|------|

**Table 55. Register description (34h)**

|            |   |
|------------|---|
| THS7, THS0 | Free-fall / Inertial Wake Up Acceleration Threshold LSB |
|------------|---|

## 7.23 FF\_WU\_THS\_H (35h)

**Table 56. Register (35h)**

|       |       |       |       |       |       |      |      |
|-------|-------|-------|-------|-------|-------|------|------|
| THS15 | THS14 | THS13 | THS12 | THS11 | THS10 | THS9 | THS8 |
|-------|-------|-------|-------|-------|-------|------|------|

**Table 57. Register description (35h)**

|             |   |
|-------------|---|
| THS15, THS8 | Free-fall / Inertial Wake Up Acceleration Threshold MSB |
|-------------|---|

## 7.24 FF\_WU\_DURATION (36h)

**Table 58. Register (36h)**

|      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|
| FWD7 | FWD6 | FWD5 | FWD4 | FWD3 | FWD2 | FWD1 | FWD0 |
|------|------|------|------|------|------|------|------|

**Table 59. Register description (36h)**

|            |   |
|------------|---|
| FWD7, FWD0 | Minimum duration of the Free-fall/Wake-up event |
|------------|---|

This register sets the minimum duration of the free-fall/wake-up event to be recognized.

$$\text{Duration(s)} = \frac{\text{FF\_WU\_DURATION (Dec)}}{\text{ODR}}$$

## 7.25 DD\_CFG (38h)

**Table 60. Register (38h)**

|      |     |      |      |      |      |      |      |
|------|-----|------|------|------|------|------|------|
| IEND | LIR | ZHIE | ZLIE | YHIE | YLIE | XHIE | XLIE |
|------|-----|------|------|------|------|------|------|

**Table 61. Register description (38h)**

|      |   |
|------|---|
| IEND | Interrupt enable on Direction change. Default value: 0<br>(0: disabled;<br>1: interrupt signal enabled)   |
| LIR  | Latch Interrupt request into DD_SRC reg with the DD_SRC reg cleared by reading DD_ACK reg. Default value: 0.<br>(0: interrupt request not latched;<br>1: interrupt request latched)   |
| ZHIE | Enable interrupt generation on Z High event. Default value: 0<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value higher than preset threshold) |
| ZLIE | Enable interrupt generation on Z Low event. Default value: 0<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value lower than preset threshold)   |
| YHIE | Enable interrupt generation on Y High event. Default value: 0<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value higher than preset threshold) |
| YLIE | Enable interrupt generation on Y Low event. Default value: 0<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value lower than preset threshold)   |

**Table 61. Register description (continued) (38h)**

|      |   |
|------|---|
| XHIE | Enable interrupt generation on X High event. Default value: 0<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value higher than preset threshold) |
| XLIE | Enable interrupt generation on X Low event. Default value: 0<br>(0: disable interrupt request;<br>1: enable interrupt request on measured accel. value lower than preset threshold)   |

Direction-detector configuration register.

## 7.26 DD\_SRC (39h)

**Table 62. Register (39h)**

|   |    |    |    |    |    |    |    |
|---|----|----|----|----|----|----|----|
| X | IA | ZH | ZL | YH | YL | XH | XL |
|---|----|----|----|----|----|----|----|

**Table 63. Register description (39h)**

|    |  |
|----|--|
| IA | Interrupt event from direction change.<br>(0: no direction changes detected;<br>1: direction has changed from previous measurement)            |
| ZH | Z High. Default value: 0<br>(0: Z below THSI threshold;<br>1: Z accel. exceeding THSE threshold along positive direction of acceleration axis) |
| ZL | Z Low. Default value: 0<br>(0: Z below THSI threshold;<br>1: Z accel. exceeding THSE threshold along negative direction of acceleration axis)  |
| YH | Y High. Default value: 0<br>(0: Y below THSI threshold;<br>1: Y accel. exceeding THSE threshold along positive direction of acceleration axis) |
| YL | Y Low. Default value: 0<br>(0: Y below THSI threshold;<br>1: Y accel. exceeding THSE threshold along negative direction of acceleration axis)  |
| XH | X High. Default value: 0<br>(0: X below THSI threshold;<br>1: X accel. exceeding THSE threshold along positive direction of acceleration axis) |
| XL | X Low. Default value: 0<br>(0: X below THSI threshold;<br>1: X accel. exceeding THSE threshold along negative direction of acceleration axis)  |

Direction detector source register.

## 7.27 DD\_ACK (3Ah)

Dummy register. If LIR bit in DD\_CFG register is set to '1', a reading at this address allows the DD\_SRC register refresh. Read data is not significant.

## 7.28 DD\_THSI\_L (3Ch)

**Table 64. Register (3Ch)**

|       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|
| THSI7 | THSI6 | THSI5 | THSI4 | THSI3 | THSI2 | THSI1 | THSI0 |
|-------|-------|-------|-------|-------|-------|-------|-------|

**Table 65. Register description (3Ch)**

|              |  |
|--------------|--|
| THSI7, THSI0 | Direction detection Internal Threshold LSB |
|--------------|--|

## 7.29 DD\_THSI\_H (3Dh)

**Table 66. Register (3Dh)**

|        |        |        |        |        |        |       |       |
|--------|--------|--------|--------|--------|--------|-------|-------|
| THSI15 | THSI14 | THSI13 | THSI12 | THSI11 | THSI10 | THSI9 | THSI8 |
|--------|--------|--------|--------|--------|--------|-------|-------|

**Table 67. Register description (3Dh)**

|               |  |
|---------------|--|
| THSI15, THSI8 | Direction detection Internal Threshold MSB |
|---------------|--|

## 7.30 DD\_THSE\_L (3Eh)

**Table 68. Register (3Eh)**

|       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|
| THSE7 | THSE6 | THSE5 | THSE4 | THSE3 | THSE2 | THSE1 | THSE0 |
|-------|-------|-------|-------|-------|-------|-------|-------|

**Table 69. Register description (3Eh)**

|              |  |
|--------------|--|
| THSE7, THSE0 | Direction detection External Threshold LSB |
|--------------|--|

## 7.31 DD\_THSE\_H (3Fh)

**Table 70. Register (3Fh)**

|        |        |        |        |        |        |       |       |
|--------|--------|--------|--------|--------|--------|-------|-------|
| THSE15 | THSE14 | THSE13 | THSE12 | THSE11 | THSE10 | THSE9 | THSE8 |
|--------|--------|--------|--------|--------|--------|-------|-------|

**Table 71. Register description (3Fh)**

|               |  |
|---------------|--|
| THSE15, THSE8 | Direction detection External Threshold MSB |
|---------------|--|

# 8 Typical performance characteristics

## 9 Package information

In order to meet environmental requirements, ST offers these devices in ECOPACK<sup>®</sup> packages. These packages have a lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK<sup>®</sup> is an ST trademark.

ECOPACK<sup>®</sup> specifications are available at: [www.st.com](http://www.st.com).

**Figure 28. LGA-16 mechanical data and package dimensions**

## 10 Revision history

**Table 72. Document revision history**

| Date        | Revision | Changes   |
|-------------|----------|---|
| 15-Feb-2006 | 1        | Initial release.  |
| 15-Jan-2008 | 2        | Added two new sections:<br><i>Section 2.3: Communication interface characteristics</i> and <i>Section 8: Typical performance characteristics</i> .<br>Content reworked to improve readability |

**Please Read Carefully:**

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document.
